

Education

- **International University Center** Curitiba, PR - Brazil
Computing Systems Analysis and Development 2022 - 2025
 - Senior Thesis: Atomic and Immutable packaging implementation for containerized workloads

Work Experience

- **SUSE** Remote
Software Engineer II, Site Reliability Engineering - Central Engineering Services August 2025 - Present
 - Technical leader responsible for creating the SUSE Customer Center internal deployment platform, which increased developer involvement by 78% and reduced customer bugs by 52% in a 3-month period. This was achieved by developing custom Kubernetes Operators wrapped under a CLI program, which aimed to make the deployment process of different environments as easy as a single-line command.
 - Responsible for the implementation and design of a department-wide unified CI/CD Pipeline strategy, as well as being the maintainer of all pipelines related to the testing and deployment of the *SUSE Customer Center* product, where all customer subscriptions are processed.
 - Leads SRE team-effort in architecting a service migration-focused sub-team. Responsible for migrating a multitude of services and accounts, with 99.9% uptime of customer-affected services, including key AWS accounts, Kubernetes workloads and CDNs, becoming the first team within SUSE to fully-host a customer-facing service in our internal Kubernetes Engine Platform (serving as the base for the Rancher Platform).
 - Responsible for managing the required infrastructure for all Public Cloud Providers (AWS, GCP, Azure, and Alibaba) and Marketplace offerings of SUSE images, including world-wide availability of RMT Server Instances and customer server-registration up-keep.
 - Created the OpenCPE (Open Cloud Policy Executor) Engine for AWS, an internally developed and now open-sourced CSP Notification system aimed at controlling Cloud resource consumption and spend.
 - Designed and created libzypp-go, a Go client for interacting with the zypper package manager, offering go bindings for the libzypp C++ Library.
 - Closely collaborated with the Essential OS Technologies team for the implementation of a git-based packaging solution, for simpler RPM package creation and maintenance. Offering technical alternatives and development of key features such as: XML package configuration, Makefile fine-tuning and CI-driven autoupdating branching models.
- **Solvefy Cloud** Florianopolis, Brazil
DevOps Engineer Nov 2024 - July 2025
 - Responsible for managing and creating solutions for Cloud GCP and On-premises environments with a focus on KVM virtualization, OpenStack, Docker and LXC container management with Native Kubernetes and GKE.
 - Software development in Java, Go and Python for internal platforms aimed at improving quality for development teams, build tooling and automation of cloud-native pipelines.
 - Leading automation, CI/CD Pipelines and Iac, with Ansible, Terraform, and GitLab CI. Responsible for automating routines and provisioning over 400 servers for continuous availability.
 - Member of the Security Committee on the software and infrastructure fronts, to implement NIST, OWASP and MITRE Attack methodologies in the secure software development lifecycle with multiple teams.
 - Leading a small team in quality engineering and test architecture design with JMeter, JUnit, TestContainers and Playwright.

- **Helte** Curitiba, Brazil
System Administrator *Jan 2024 - Nov 2024*
 - Development of container and cloud technologies in Python for automation and optimization of the development environment, testing for releases and provisioning of machines.
 - Participation in task forces focused on containerization, virtualization, VM administration and container orchestration (Kubernetes, Docker, ECS).
 - Complete administration of AWS and GCP solutions (Route53, ECS, SQS, API Gateway, Lambda, IAM, AWS cross-account/region, VPCs, Google Secret Manager, CloudFront, SSM, WAF and Cloud Armor).

- **Senff Financial** Curitiba, Brazil
Infrastructure Analyst *Feb 2023 - Jan 2024*
 - Development of system automation solutions, including in-house development of platforms to facilitate online payment authentication processes run on AWS instances, as well as managing the Rancher Kubernetes Engine Platform.
 - Responsible for deploying, configuring and maintaining clusters, sizing nodes, scheduling pods, allocating resources and planning for disaster recovery.
 - Infrastructure support for the technical support team, serving more than 700 employees.

Skills

Languages: Go, C/C++ , Unix Shell, Python, Ruby

Operating Systems: Linux, OpenBSD, macOS, UNIX

Security: NIST, OWASP, and Extensive experience testing code for security compliance, training Junior developers on security-related errors, as well as auditing existing legacy code for security bugs

Open Source Projects

2026–Present Actively working on libzypp-go, a Go Client for manipulating the zypper package manager.

2025–Present OpenCPE (Open Cloud Policy Executor) for AWS. Developed through SUSE's 2025 Hack Week and gained multiple-team adoption.

2025–Present Maintainer of the micro-editor package for all SUSE distributions, making it available for the first-time for all architectures (aarch64, s390x, PowerPC, z/OS).

2025–Present Active contributor to SUSE's RMT(Repository Mirroring Tool), working on porting to Cloud-Native environments, specifically to AWS.

2024 Contributed with testing integrations to testcontainers.

Conferences

"Cloud-Native Cluster Security with Policy as Code: present limitations and future perspectives"
DevOpsDays Curitiba 2025 in Curitiba, Brazil.

"An Introduction to Git-based Packaging for OpenSUSE Leap and Tumbleweed" *OpenSUSE America Summit 2026* in Barranquilla, Colombia.
